About

The Jira REST API enables you to interact with Jira programmatically. Use this API to build apps, script interactions with Jira, or develop any other type of integration. This page documents the REST resources available in Jira Cloud, including the HTTP response codes and example requests and responses.

Version

This documentation is for **version 2** of the Jira Cloud platform REST API.

The latest version of the Jira Cloud platform REST API is **version 3**, which is in beta. Version 2 and 3 of the API offer the same collection of operations. However, version 3 provides support for the [Atlassian Document Format \(ADF\)](#). The ADF features in version 3 are under development.

Authentication and authorization

Forge apps

For Forge apps, **REST API scopes** are used when authenticating with Jira Cloud platform. See [Add scopes to call an Atlassian REST API](#) for more details.

The URIs for Forge app REST API calls have this structure:

`/rest/api/3/<resource-name>`

For example, `/rest/api/3/issue/DEMO-1`

Connect apps

For Connect apps, authentication (JWT-based) is built into the Connect libraries. Authorization is implemented using either scopes (shown as *App scope required* for operations on this page) or user impersonation. See [Security for Connect apps](#) for details.

The URIs for Connect app REST API calls have this structure:
